

## Invest in your basic needs by crowdfunding the future infrastructure of your community.

### did you know?

1500 locals, paying €2000 each, buys a 3mW windmill that can cover all their power needs?

### The future is bright.

We'll soon be powering our communities with energy from the sun and wind. Self-driving cars will get us around town at the click of a button. Delivery drones will move around tools, medicine, and packages without an operator.

And guess what?

The sun doesn't charge us an energy bill. Autonomous cars and drones don't ask for a wage and work 24/7.

### We're on the cusp of an economic revolution.

### The future will be built bottom-up.

Uber uses a **top-down** approach. They plan and deploy a monopolized mobility network in communities across the world so that they **can charge for access**.

NestEgg empowers the true sharing economy, built **bottom-up** by locals building autonomous infrastructure in their communities, so that they **own access to it**.

In aggregate, the individual builds of these local communities will be creating a global network of **energy, mobility, and access**. Improving the quality of life for their communities and generations to come.

NestEgg is a platform for individuals to discover and participate in crowdfunds of infrastructure being built in their community. Together, they'll own these new installations and reduce their cost of living by owning access to it.
