

Create life-security by reducing your cost of living, through creating a future you believe in.

How do individuals create their own life security, 30-50 years from now, **without relying on banks or other financial institutions?**

We turn towards the community, enabling all citizens to crowdfund the infrastructures that would improve their standard of living. By doing so, ownership of necessary daily utilities belong to the community, providing the crowdfunders regular dividends. These dividends, such as free energy (kWh) delivered from a crowdfunded windmill, or free transport through a fleet of self-driving cars, **allows an individual to reduce their future cost of living, by owning the infrastructure they use everyday.**

This enables communities to fund their own windmills, solar panels, self-driving cars, and drone networks; **empowering communities to take the future into their own hands, building what they want to own.**
